

# DE BEERS GROUP

## **Precision machining:** giving toolmakers a competitive edge

PCD, PCBN, CVD diamond and single crystal diamond solutions

# Competitive advantage through innovation

At Element Six, we work in collaboration with our customers to develop cutting-edge solutions and materials. We have a proven commitment and capacity to deliver innovative polycrystalline diamond (PCD), polycrystalline cubic boron nitride (PCBN), tungsten carbide (WC), chemical vapour deposition (CVD) and single crystal diamond solutions that enable next generation performance in metalworking applications.

Our state-of-the-art Global Innovation Centre (GIC) located near Oxford, UK, gives us unique access to firstclass research and development facilities that enable us to develop and enhance our innovative supermaterials solutions. We strive to continually find new ways to transform the extreme properties of our synthetic diamond and tungsten carbide solutions, to deliver next generation performance. Precision machining

# PCD grades and characteristics

| Grade  | Applications  | Charac  |
|--------|---|---|
| CMX850 | Ideal for milling and rough<br>cutting of aluminium alloys<br>where extreme chip resistance<br>is required, also for machining<br>titanium and composites                                 | Sub-mia<br>ultra-fin<br>applicc<br>are req<br>sharpne |
| СТХ002 | Ideal for profile routers and<br>thread cutting tools, can also be<br>used in wear part applications  | 2 µm a<br>cobalt<br>ideal fc<br>process               |
| СТВОО4 | Ideal for cutting of aluminium<br>alloys where high surface finish is<br>required alongside higher wear<br>resistance   | 4 µm a<br>4-micro<br>the opt<br>perform<br>and ch     |
| СТВО1О | The ideal grade where roughing<br>and finishing are performed<br>with a single tool. Highly<br>recommended for low to medium<br>content aluminium alloys                                  | 10 µm<br>the wor<br>applice<br>toughne                |
| CTH025 | Successful in machining of high<br>silicon aluminium alloys, metal<br>matrix composites (MMC),<br>tungsten carbides and ceramics  | Averag<br>offers c<br>abrasiv                         |
| CTM302 | Application areas include MMC,<br>high silicon aluminium alloys,<br>high strength cast irons and<br>bi-metal applications. Excellent<br>abrasion resistance and good<br>thermal stability | A multi-<br>of 2 µn<br>CTM3(<br>strength              |

### cteristics

icron grain size. CMX850's ne grain structure is suitable for cations where mirror finishes quired due to its extreme edge ness/retention

average grain size with increased t for ease of processing. CTX002 is for complex tools where excessive ssing is required

average grain size. CTB004's ron fine grain structure offers ptimum balance between tool mance and resistance to abrasions hips

n average grain size. CTB010 is orkhorse PCD grade, ideal for many ations where a good balance of ness and wear resistance is required

ge grain size of 25 µm. CTH025 optimum wear resistance for we machining conditions

ti-modal PCD with a combination im to 30 µm grain sizes, giving 302 excellent wear resistance, edge th and edge quality

### Microstructure

Work material characteristics and to a lesser extent, cutting parameters, determine the demands placed on the cutting tool and hence, the optimum balance of tool material properties. Knowledge of the application, including workpiece composition, facilitates selection of the optimum grade and selection of the correct tool geometry. Often, work material composition and machining parameters (vc, f, ap) go hand in hand. It is possible, therefore, only to provide a typical range of values for each parameter.

PCD layer profile Element Six supplies a unique ultrasonic scan depicting the PCD layer profile. The PCD scan indicates a 'North Point', which matches a 'North Point' laser marked on the disc, allowing users to optimise the cutting areas.

characteristics

# Choosing the right PCD grades

### PCD grades for wider usage

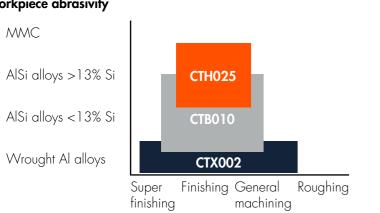

Improvements in synthesis techniques coupled with new product development capability have generated two PCD grades, CMX850 and CTM302, that possess the properties to meet all known tool performance challenges. CTM302 provides the ultimate abrasion resistance while CMX850 provides the optimum balance of processability and performance.

### 4 main factors to consider when selecting PCD grades Chip resistance Behaviour in Abrasion resistance \_ application Electro-discharge characteristics Processing

Grindability

characteristics

### Materials and machining

Element Six PCD grades provide the ideal balance between behaviour in application and processing characteristics to meet the requirements of the cutting or grinding operation.

- e extended by nes compared to de drills
- ound disc formats ble
- segments available ut to order

- infinite flexibility point geometry Tool life more than 10 times longer than tungsten carbide drills • Large rake angles

# Setting tool design free

Our Aero-Dianamics<sup>™</sup> range of round tool blanks provides tool designers with the ability to create entirely new PCD tool geometries that break through existing barriers in PCD tool design, with:

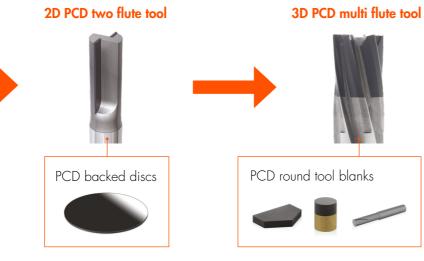

- Freedom of design in flute profiles
- Multiple flutes
- Limitless flute angles and orientations

### Aero-Dianamics<sup>™</sup> - transforming composite tooling

These next generation composite tooling solutions entirely replace the need for coated tungsten carbide tools for fabricating composite components.

### 3D tungsten carbide tool

### Revolutionary A3MH blanks for milling tools

Our Aero-Dianamics<sup>™</sup> milling range enables significant improvements in productivity over coated tungsten carbide tools:

- 3-12 x faster machining speeds
- Lower cutting forces
- Improved tool evacuation

### A3DP planar blanks for complex drill geometries

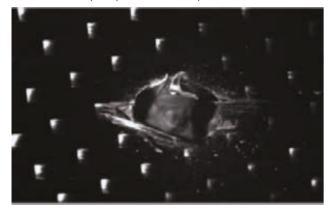

Our Aero-Dianamics<sup>™</sup> drilling range enables significant improvements in productivity over coated tungsten carbide tools:

- Significantly increased wear resistance over coated carbide drills
- 10 x longer tool life in drilling CFRP
- 2 x speed of drilling CFRP/ Al
- Consistent performance over tool life
- Superior workpiece finish

### Achieving a superior edge quality and improved productivity

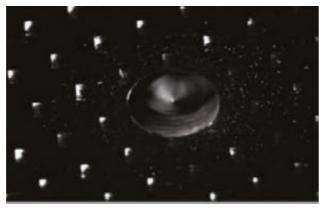

### Tungsten carbide

Hole surface quality on CFRP test piece

### A3DP planar

Drills faster and provides a consistently clean finish

### Choosing the right CVDite grade

Element Six's CVDite is most commonly suited to the machining of non-ferrous materials where high abrasion resistance is required. CVDite has high thermal stability and more wear resistance than PCD.

Due to its high abrasion resistance and low coefficient of sliding friction, the CVDite range is also ideal for uses in lubricated and dry wear part applications.

### racteristics

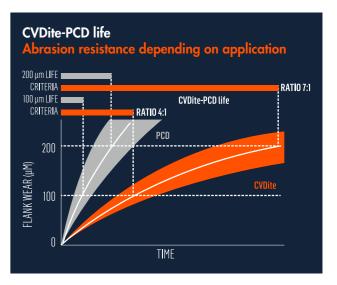

lectrically conducting grade of CVD utting tool applications, that allows omers to use EDM machining or EDG ling within their tooling processing

eneral purpose mechanical grade for ng tools

### Microstructure

- Extreme abrasion resistance
- Ideal for applications where higher temperature operating conditions are seen
- High purity

# Single crystal diamond grades & characteristics

**Characteristics** 

### Single crystal MCC

### Applications

MCC is available in 2pt and 4pt orientations. Ultra-precision machining acrylics, copper, germanium. Generates very high surface finishes.

### Produced under ultra-high purity conditions, giving it a colourless appearance. It offers a combination of extreme wear resistance, excellent chip resistance and high thermal conductivity combined with low thermal expansion.

# Applications Characteristics Primary applications for Monodite are engineered cutting tools and wear parts Manufactured using a proprietary high pressur synthesis process and pale yellow in colour. The synthesis process and pale yellow in colour. The synthesis process and pale yellow in colour. The synthesis process and pale yellow in colour.

engineered cutting tools and wear parts for super finishing, burnishing, wire guides and ultra-precision machining.

Manufactured using a proprietary high pressure, high-temperature synthesis process and pale yellow in colour. The result is a single crystal synthetic diamond that is highly consistent and has predictable properties and behaviours, offering an unparalleled choice of synthetic diamond required for cutting tool applications.

| Product range   | Key product features   | Primary application  |  |
|---|--|--|--|
| MSP   | Individually priced, large edge length<br>plates                       | Long edge length<br>requirements (e.g. profile<br>tools)   |  |
| MLP   | Long edge length, polished near-<br>rectangular logs                   | Long edge length<br>requirements (e.g.<br>controlled waviness tools)   |  |
| MT L (rectangular)<br>MT T (triangular)<br>MT R (round) | Highly engineered polished plates, laser<br>cut to specific dimensions | Engineered cutting tools<br>and wear parts for<br>superfinishing, burnishing<br>and wire guides<br>Convenient cut shapes       |  |
| МХР   | Near-square plates having guaranteed inscribed square                  |  |  |
| MWS PT4   | Near-round plates having guaranteed inscribed circle                   | <ul> <li>Superfinishing and</li> <li>precision machining</li> <li>(e.g. precious metals</li> <li>and MMC materials)</li> </ul> |  |
| MWS PT2   | Engineered polished plates benefiting from 2pt orientation             |  |  |

### Benefits of Element Six single crystal

- Highly consistent, predictable properties and behaviour
- Unrivalled surface finish and component accuracy performance unattainable with conventional polycrystalline tool materials
- Surface roughness values are of the order of nanometres and form accuracies are commonly sub-micron
- Facilitates the manufacture of cutting tools with edge roughness and sharpness values in the order of 10 nm and form accuracies in the micrometre range

### PCBN synscan

Element Six supplies a unique ultrasonic scan depicting the PCBN layer profile.

The PCBN scan indicates

a 'North Point', which matches a 'North Point' laser marked on the disc, allowing users to optimise the cutting areas.

10

### Our unique scalable segmentation service

Our fast, high quality and cost-effective segmentation service is supported by the largest laser cutting and electrical discharge machinery (EDM) capacity of all abrasive manufacturers. We provide both standard and complex bespoke geometries.

# PCBN grades and characteristics

| Grade  | Applications   | Characteristics  | Microstructure   |
|--|--|--|--|
| DCN450<br>(WC-<br>backed)<br>DSN450<br>(solid) | For moderately interrupted hard turning and finish<br>hard milling as well as high speed continuous<br>turning. Its resistance to crater wear is among<br>the highest in the market. With one of the finest<br>structures of all commercial grades, DCN450<br>provides for sub-µm surface roughness                                  | <ul> <li>Approximately 45% CBN</li> <li>Sub-µm CBN grain size</li> <li>TiCN binder</li> </ul>  |  |
| DCC500<br>(WC-<br>backed)<br>DSC500<br>(solid) | For continuously and lightly interrupted cutting<br>of the majority of automotive steels. Excellent<br>abrasion resistance makes it the ideal choice<br>for cold work tool steels and certain valve seat<br>alloys. Also recommended for finishing abrasive<br>high strength cast irons  | <ul> <li>Approximately 50% CBN</li> <li>1.5 µm average grain size</li> <li>Principally TiC binder</li> </ul>   |  |
| DHA650   | For moderately to heavily interrupted hard turning<br>and finish hard milling in both dry and wet<br>conditions. Suitable for both conventional and<br>elevated machining speeds   | <ul> <li>Approximately 65% CBN</li> <li>Binder phase includes TiC/<br/>TiN</li> </ul>  |  |
| DCX650   | For moderately to heavily interrupted turning<br>of all common hardened steels. Provides an<br>excellent balance of toughness, and crater and<br>flank wear resistance. Also used for plunge<br>machining of valve seat rings  | <ul> <li>Approximately 65% CBN</li> <li>Average 3 µm proprietary<br/>multi-modal grain size</li> <li>TiN binder</li> </ul>   |  |
| DBW85  | For applications such as grey iron fine boring<br>and valve seat machining, due to excellent<br>strength and abrasion resistance. Ideal for<br>heavily interrupted cutting of all hard and<br>abrasive work piece materials, including powder<br>metallurgy components. Proven performance also<br>in hard fine milling applications | <ul> <li>Approximately 85% CBN</li> <li>2 µm average grain size</li> <li>AlWCoB binder for extreme chip resistance</li> </ul>  |  |
| DBS900   | Ideal for applications where longer tool life is<br>required. Excels in interrupted machining of grey<br>and hard cast irons, hardened steel milling and<br>in the machining of the majority of valve seat<br>ring alloys. Excellent first choice grade for the<br>majority of ferrous powder metals                                 | <ul> <li>Approximately 90% CBN</li> <li>4 µm average grain size</li> <li>Novel binder system<br/>to provide the ultimate<br/>abrasion and chip<br/>resistance</li> </ul> |  |
| AMB90  | For turning and milling of grey and hard cast<br>irons and heavy turning of hardened steels;<br>including components such as brake discs, pump<br>bodies and impellers and large rolls   | <ul> <li>Approximately 90% CBN</li> <li>Binder phase includes<br/>aluminium nitrides and<br/>borides</li> </ul>  |  |
| AMK90  | For similar application areas as AMB90, but<br>providing higher wear resistance. Exhibits<br>particularly high performance in abrasive work<br>materials such as high chrome cast irons. Usable<br>edges on both faces of insert   | <ul> <li>Approximately 90% CBN</li> <li>Binder phase includes<br/>aluminium nitrides and<br/>borides</li> </ul>  |  |
| ZAA  | A value-orientated grade for turning of grey cast<br>iron, including components such as brake discs<br>and pump bodies   | <ul> <li>Approximately 90% CBN</li> <li>Binder phase includes<br/>aluminium nitrides and<br/>borides</li> </ul>  | a approximation and approximation of the second |

# Supporting the switch to higher performing solid PCBN

Element Six's low-content solid PCBN grades, DSN450 and DSC500, offer significant advantages over their WC-backed PCBN equivalents. Their uniform and self-supporting structures significantly increase tool life and provide unique opportunities for innovation in tool design giving toolmakers a technical and commercial edge.

PureCut<sup>™</sup> grade DHA650 is only offered in solid PCBN format and shares the same benefits as DSN450 and DSC500.

| Solid DSN450 WC | <br>Backed DCN450 |
|-----------------|-------------------|
| Solid DSC500 WC | <br>Backed DCC500 |

### Discovering competitive advantage with solid PCBN

With an identical structure, it has never been easier to make the switch from WC-backed PCBN. The benefits of our low-content solid PCBN grades, DSN450 and DSC500, include:

- Highly adaptable and fully conductive
- Discs can be cut using EDM wire machines and configured into many shapes and geometries, offering greater flexibility in design to differentiate product lines
- Can be brazed directly onto tool substrates through advances in active brazing capabilities, reducing production costs
- Free of bi-metal stress, reducing instances of chipping and cracking during brazing
- Can be supplied at any thickness between 1.0 mm - 10.0 mm

### Proven performance

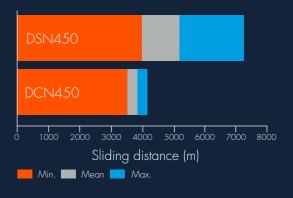

In our application tests under laboratory conditions in continuous turning of hardened steel 60 HR, our solid PCBN significantly extended mean tool life by:

- up to 40% with DSN450
- up to 35% with DSC500

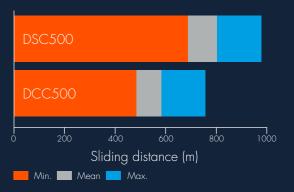

Extended tool life means better performance and reduced costs for end users.

Sliding distance results in continuous machining of hardened steel 60 HRC (SAE620)

### Solid PCBN (DSN450) vs. WC-backed PCBN (DCN450)

### Solid PCBN (DSC500) vs. WC-backed PCBN DCC500)

### **Test conditions**

Feed rate: Depth of cut: Failure mode: Edge chipping

Cutting speed: 200 m/min 0.1 mm/rev 0.15 mm

SAE8620

ISO1832 prescribes several edge conditions, three of which are most commonly applied to PCBN indexable inserts.

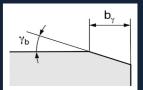

Indexable inserts made in accordance with ISO16462 are obliged to indicate the edge condition, expressed as a letter symbol (e.g. S, T, E). Five digits indicate the T-land dimensions. Hone dimensions are not indicated in ISO designations.

Example: CNGA120408 \$ 015 30 • Chamfer angle, **y**b in degrees

### Chamfer and hone

- Stronger than T-land - First choice for HPT
- Feed must be greater than hone size
- ageing
- 4. to hardening of the component
- result in adverse machining vibrations
- securely bear the cutting load
- required tool life
- 9. ADI: Austempered Ductile Iron
- range indicated 3. VSR: Valve Seat Rings
- characteristics

Honed edge • Hone size is more difficult to control than chamfers, but popular for HRSAs

Chamfer / T-land • The larger the T-land width and angle, the higher the forces

For cast iron and roll machining, solid grades AMB90 and AMK90 are more economical, while DBW85 and DBS900 provide for a superior finish and greater edge strength; e.g. for positive inserts or a heavily interrupted cut

Performance for grey irons can vary depending on casting quality and degree of

The feed is selected with nose radius according to surface roughness requirements The depth of cut is typically determined by stock removal allowance (oversize) prior

While there is no strict minimum feed or depth of cut, excessively low values (e.g., < 0.02 mm) may result in adverse machining vibrations

6. While a larger nose radius provides a stronger edge, excessively large values may

For braze-tipped tools, the segment area (in mm<sup>2</sup>) should be > 100\*f\*ap so as to

Indicated cutting speeds for hard steels are primarily for case hardened steels. For higher alloy steels, it may be necessary to reduce the cutting speed to achieve the

10. CGI: Compacted Graphite Iron (also known as vermicular iron)

. Compacted graphite cast irons are also successfully machined with PCD - we recommend CTM302. The cutting speed for PCD should be 200 +/- 50 m/min 2. Milling of grey cast irons is typically done within the upper portion of the speed

4. Super-alloys - also known as heat resistant superalloys (HRSA) - consist of a very large range of compositions and properties, resulting in very different machining

5. For HRSAs it is preferable to use round inserts. It is also advisable to assess the use of un-chamfered, but honed, cutting edge geometries

6. PureCut™ grades are designed to operate at higher speeds than E6's other grades. Please contact E6 technical support for further details

# Reduce downtime and improve productivity by converting to integral inserts

With increasing pressure from competitors and end users, tool manufacturers are always looking for ways to simplify the manufacturing process, raise productivity and reduce costs. By switching from brazed inserts to centre-lock full-face inserts, these aspirations can become a reality.

### High performance components

Centre-lock full-face PCBN inserts provide for easily manufactured multi-cornered tools with a number of benefits:

- A more robust cutting component than a conventional brazed tool
- Greater reliability in interrupted cutting applications
- Elimination of the braze joint allowing higher temperature coatings to be applied
- Reduced insert failure risks and improved production continuity
- Longer cutting edges that enable productivity improvements in application; either through the use of larger depths of cut or plunge-type machining operations
- High and low CBN content configurations

### The benefits of using centre-lock full-face inserts

- Eliminate pocketing and brazing procedures
- Improved precision by eliminating brazing inaccuracies
- Reduce the amount of handling
- Cut the overall production cost per usable corner
- Apply higher temperature coatings
- Shorten the production pipeline by eliminating the need for:
  - carbide preparation
  - segment cleaning
  - brazing
  - after-brazing cleaning

# Standard PCBN range available

IC - Inscribed Circle

- Tolerance on overall thickness +/-0.05 and IC tolerance +/- 0.10 mm
- 2. Grinding allowances apply, IC diameters shown will be produced with a 0.3 mm grinding
- 3. All measurements are mm

### PCBN grade availability

Centre-lock full-face PCBN inserts are available in all WC-backed PCBN grades.

### End user benefits

Machine operators and engineering managers value the benefits of integral inserts over brazed inserts; the ability to switch from corner to corner means that maintaining production continuity is simply a matter of adjusting the insert. The longer cutting edges of an integral insert also enable plunge machining which can achieve valuable gains in productivity and reductions in both downtime and costs.

# elementsix ...

DE BEERS GROUP

Element Six is a global leader in the design, development and production of synthetic diamond and tungsten carbide supermaterials. Part of the De Beers Group, we employ over 1,900 people. Our primary manufacturing sites are located in the UK, Ireland, Germany, South Africa, and the US.

Since 1959, our focus has been on developing the diamond synthesis process to enable innovative synthetic diamond and tungsten carbide solutions. As well as being the planet's hardest material, diamond's extreme and diverse properties give it high tensile strength, chemical inertness, broad optical transmission and very high thermal conductivity.
